

Technical Data Sheet **NASA 100 PLUS**

1. Description

- Thermoplastic, polyolefine-based hotmelt film.

2. Characteristics

- <u>NASA 100 PLUS</u> is a hotmelt film for shoe industry. Unlike general TPU hotmelt film, NASA 100 PLUS shows the excellent bonding strength to EVA foam due to its inherent non-polar chemical structure. And also its low viscous behavior help moderate adhesion to polar chemical structure materials like PU foams and textiles.

3. Typical properties

| Appearance | Single layer thin film (No release paper) |
|--------------------|---|
| Thickness | 35um, 40um, 50um (Variable) |
| Width | 44 inch (Variable) |
| Melting pt. in DSC | Broad detection. Please refer Tfb |
| Tfb | 105±5°C |
| Melt Flow Index | 10~20 g/10min (177°C, 2.16kgf) |

4. Application

- NASA 100 PLUS can be used by hot-pressing process.

This material will be a best practice for the bonding between EVA foam and textiles like in-sole manufacturing.

Working condition in hot-pressing process might be widely varied according to the kind of base materials. So we do not mention the specific condition in this document.

5. Packaging

- Rolls in ordered length. Normally, 500meters with 44inch width.

6. Storage

Store at a dry and cool place. Keep it out of sun-light(UV) Without opening the packaging Shelf life : 12 month after production(Without opening the packaging)

· HEAD OFFICE

7. Disposal

he scrap of <u>NASA 100 PLUS</u> can be collected and recylced though packing material. On the surface of collecting bag, "<u>NASA 100 PLUS</u>" should be marked because the material type is different from TPU film

8. Safety

We consider <u>NASA 100 PLUS</u> does not have serious problem to workers. But be careful when handling rolls because they are very heavy. Please refer to MSDS for more detailed information.
